

# Dual preamplifier with ALC

## BA3308 / BA3308F / BA3308FV

The BA3308, BA3308F and BA3308FV are dual preamplifier ICs with built-in ALC circuits, and have been designed for use in stereo radio-cassette recorders and tape recorders. They come in compact 9-pin SIP (BA3308), 14-pin MF (BA3308F) and 14-pin SSOP (BA3308FV) packages, and have two record/playback preamplifiers, and an ALC circuit. The preamplifiers have high gain and low distortion, and can be directly coupled to the tape head without coupling capacitors. This prevents tape head magnetization and "pop" noise generation.

A built-in rectifier means that an ALC circuit with good channel balance and large dynamic range can be constructed with addition of just an external time constant circuit.

The ICs also include power-on mute circuits that suppress "pop" noise generation.

### ●Applications

Stereo radio cassette recorders, cassette decks and home stereo systems and music centers

### ●Features

- 1) Built-in ALC rectifier diode.
- 2) Wide operating power supply voltage range ( $V_{CC} = 4.5V$  to  $14V$ ).
- 3) Low current dissipation ( $I_Q = 3.5mA$ ).
- 4) High gain ( $G_{VO} = 80dB$ ).
- 5) Low distortion (THD = 0.1%).
- 6) Low noise ( $V_{NIN} = 1\mu V_{rms}$ ).
- 7) Input coupling capacitors and not necessary.
- 8) Good ALC channel balance.
- 9) Power-on mute circuit.
- 10) ALC dynamic range can be varied by the addition of an external input resistor.

### ●Absolute maximum ratings ( $T_a = 25^\circ C$ )

Parameter	Symbol	Limits	Unit
Power supply voltage	$V_{CC}$	16	V
Power dissipation	BA3308	950 *1	mW
	BA3308F	450 *2	
	BA3308FV	350 *3	
Operating temperature	$T_{opr}$	$-25 \sim +75$	$^\circ C$
Storage temperature	$T_{stg}$	$-55 \sim +125$	$^\circ C$

\*1 Reduced by 9.5mW for each increase in  $T_a$  of  $1^\circ C$  over  $25^\circ C$ .

\*2 Reduced by 4.5mW for each increase in  $T_a$  of  $1^\circ C$  over  $25^\circ C$   
(when mounted on a 70mm x 70mm x 1.6mm glass epoxy board).

\*3 Reduced by 3.5mW for each increase in  $T_a$  of  $1^\circ C$  over  $25^\circ C$ .

### ●Recommended operating conditions ( $T_a = 25^\circ C$ )

Parameter	Symbol	Min.	Typ.	Max.	Unit
Power supply voltage	$V_{CC}$	4.5	—	14	V

●Block diagram

●Electrical characteristics (unless otherwise noted,  $T_a = 25^\circ\text{C}$ ,  $V_{CC} = 7.0\text{V}$ ,  $f = 1\text{kHz}$  and BPF: 20Hz to 20kHz)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Conditions
Quiescent current	$I_Q$	1.5	3.5	4.5	mA	$V_{IN}=0V_{rms}$
Open loop voltage gain	$G_{VO}$	70	80	—	dB	$V_{OUT}=-10\text{dBV}$
Total harmonic distortion	THD	—	0.1	0.3	%	NAB34dB, $V_{OUT}=40\text{mV}_{rms}$
Input resistance	$R_{IN}$	15	25	45	k $\Omega$	—
Maximum output voltage	$V_{OM}$	0.6	1.2	—	$V_{rms}$	THD=1%
Input conversion noise voltage	$V_{NIN}$	—	1.0	2.0	$\mu V_{rms}$	Conversion with $R_G=2.2\text{k}\Omega$ and NAB 34dB at 1kHz
ALC range	ALC	40	45	—	dB	$R_G = 3.9\text{k}\Omega$ , $V_{IN}=-70\text{dBV}$ reference, THD=3%
ALC channel balance	$\Delta\text{ALC}$	—	0	2.5	dB	$V_{IN}=-60\text{dBV}$ , $-30\text{dBV}$
Channel separation	CS	60	75	—	dB	$V_O=0\text{dBV}$ , NAB34dB

## ● Total application circuit

## Notes:

- (1) Switches are in the playback positions.
- (2) Set the values of  $R_A$  and  $C_A$  depending on the characteristics of the playback/recording head.
- (3) The capacitor  $C_B$  is for head resonance treble compensation during playback, and prevention of high-frequency noise. The recommended value is about 1000pF.
- (4)  $L$  and  $C_C$  are a bias trap.

Fig. 4

## ● Circuit operation

## (1) Recording

## 1) Recording amplifier (See Fig. 5)

The channel 1 and 2 amplifier input stages of the BA3308 (pins 8 and 2) can be direct-coupled, and the input coupling capacitors  $C_1$  and  $C_2$  are not particularly required. The voltage gain of the recording amplifier is given by  $G_V = R_5/R_3$ , but as a "pop" noise is generated when power is applied, (see "operation notes"), use the time constant circuit values given for  $C_3$  and  $R_3$  ( $C_4$  and  $R_4$ ) in the application example circuit diagram, or values close to these, and adjust the voltage gain with  $R_5$  ( $R_6$ ).  $R_5$  ( $R_6$ ) is also the DC bias feedback resistor, and is connected between pin 3 (7), and the output capacitor  $C_5$  ( $C_6$ ).

## 2) ALC (See Fig. 6)

The BA3308 includes a signal rectifier block and electronic potentiometers required for the ALC. In the signal rectifier block, a comparator compares the DC output voltage component of the output stage signal (pins 3 and 7) to a voltage of  $4.5V_F$  ( $1V_F$  is about 0.7V, so  $4.5V_F$  is approximately 3V), and if it is above this, the comparator switches on, and charges the smoothing capacitor  $C_7$ . The operating point of the amplifier's ch1 and ch2 output

stages is fixed at  $3V_F$ , so when the signal output voltage is  $1.5V_F$  (an effective value of approximately 0.75V), the comparator goes on, DC signals for electronic potentiometer control are generated, and the ALC starts operating.

The electronic potentiometers are connected between the input lines (pins 2 and 8) and GND, and the input signals is attenuated by the ratio of the electronic potentiometer resistances and the external resistors  $R_1$  and  $R_2$ . The range of the ALC can be varied by the values of  $R_1$  and  $R_2$ , but if they are too large the S/N ratio will worsen. Sufficient ALC range should be obtained with  $R_1$  and  $R_2$  values of around several kohms.  $C_7$  and  $R_7$  connected to pin 5 set the ALC attack and recovery times. The larger the values of these constants, the longer the recovery time, and the smaller the value of  $C_7$  the shorter the attack time.

(2) Playback (See Fig. 7)

During playback, the ch1 and ch2 amplifiers are used as NAB equalizer amplifiers, and time constant circuits are connected between pins 1 and 3, and 7 and 9 in the negative-feedback section to give the NAB characteristics. The voltage gain is given by:

$$G_V = | R_{11} + R_9 / (1 + j\omega C_9 \cdot R_9) | / R_3$$

In the same way as for recording, the NAB time constant circuit is adjusted to give the required gain (to prevent

generation of a “pop” noise when power is applied). The output stage (pins 3 and 7) operating point is fixed at  $3V_F$ . Therefore, as indicated in the  $V_{Max.}$  vs.  $V_{CC}$  characteristic (see Fig. 19), even if the  $V_{CC}$  voltage is made larger than 5V, the maximum output voltage will not exceed 1.2V (typ.). The ALC circuit is not required for playback, so pin 5 is grounded. The S/N ratio during playback is better if the external resistors  $R_1$  and  $R_2$  that are connected to the input pins (2 and 8) for recording are switched out.

Fig. 7

●Operation notes

The BA3308 has a built-in power-on mute circuit to prevent generation of a “pop” sound when the power is applied. The generation of the “pop” sound is prevented by the DC blocking capacitors C<sub>3</sub> and C<sub>4</sub> connected to pins 1 and 9, and the charge time required for the ripple filter

capacitor C<sub>8</sub> that is connected to pin 6. To ensure correct operation of this circuit, use the values given in the application example circuit for C<sub>3</sub>, C<sub>4</sub>, R<sub>3</sub>, R<sub>4</sub>, C<sub>8</sub> and R<sub>8</sub>.
